Atomic Force Microscopy (AFM)

Here some of the original AFM data are presented.

Fig. S1 AFM image of fd-virions grafted with dA oligonucleotides. No aggregation between similar coated virions is observed. Apparent aggregation is only due to the drying process and due to the added Ca^{2+} used to bind the virions to the support surface.
**Fig. S2** AFM image of a 1:1 mixture of dA and dAP grafted fd-virions, showing typical 'open' aggregates.
**Fig. S3** AFM image of fd-virions grafted with dA oligonucleotides. Zooned-in detail of a typical aggregate.
